Subject: Alliance with Systems With Intelligence Inc

GDI Communications LLC is pleased to announce an alliance with Systems With Intelligence Inc for the Transportation and Traffic marketplace.

Systems With Intelligence Inc. provides intelligent video solutions for the electric utility industry and other mission critical applications found in harsh and remote environments. Systems With Intelligence is an OEM (Original Equipment Manufacturer) that designs, manufactures, and integrates various best in class components to offer complete video solutions tailored specifically for the target application in the areas of physical security, asset monitoring, video automation and safety. Supplying substation and industrial hardened equipment coupled with sophisticated video management software that incorporates advanced video analytics technology, Systems With Intelligence's video solution provides highly reliable operation in harsh environments to ensure that mission critical operations and assets are effectively protected and operating at peak efficiency.

Systems With Intelligence management, commercial, and technical teams are comprised of seasoned professionals who have extensive and proven experience in the application of advanced technology solutions for mission critical applications and harsh environments. Our experience and domain expertise in substation and industrial automation, information technology, and utility and industrial operations makes us uniquely positioned to deliver effective intelligent video solutions, since we understand the requirements and challenges faced by our customers.

PRODUCTS

A typical video monitoring system utilizes components such as video cameras, digital video servers, recorders, video management software, video analytics, storage systems,

remote access and event notification tools, and other auxiliary components (such as communications equipment, power supplies, cabling, etc).

Generally speaking, most commercially available products have been designed to operate in an office type environment. However, the harsh environments present within electric utilities and industrial applications requires video monitoring equipment that is significantly more robust and which contains specialized components that are less susceptible to failure and which can compensate for less than ideal conditions, to ensure that the system remains operational and reliable. In addition, the uncontrolled environments of many sites (eg. temperature, EMI, humidity, poor and inconsistent lighting, rain, snow, etc.) make it impractical to utilize video servers, cameras, and software algorithms that have been designed for more commercial applications.

All Systems With Intelligence products and solutions have been specifically designed for electric utility and industrial applications, with special emphasis on remote applications.

Systems With Intelligence Product Portfolio
